

Xufeng Duan

Email: xufengduan@cuhk.edu.hk Tel: 66731863

Research interests: Psycholinguistics, Neurolinguistics, Mechanistic Interpretability

EDUCATION

The Chinese University of Hong Kong	2020–2025
Department of Linguistics and Modern Languages	Ph.D. in Linguistics
The Chinese University of Hong Kong	2019–2020
Department of Linguistics and Modern Languages	M.A. in Linguistics
Sun Yat-sen University	2015–2019
Neurolinguistics Laboratory	B.A. in Chinese

CURRENT POSITION

The Chinese University of Hong Kong	2025–Present
Brain and Mind Institute	Research Assistant Professor

PREVIOUS RELEVANT RESEARCH WORK

My research integrates **artificial intelligence (AI) and psycholinguistics** to develop an emerging field of *AI for Psychology*. This proposal extends a coherent research trajectory in which I have progressively established the three methods of the current project: multi-agent reasoning, automated stimulus construction, and AI-based behavioural simulation.

First, I developed **multi-agent frameworks** that emulate scientific reasoning. *StimMAS* (Duan, Xiao, Kan, & Cai, 2025) introduced a multi-agent system that generates, critiques, and validates linguistic stimuli, demonstrating how distributed AI agents can coordinate hypothesis testing under psycholinguistic constraints. Related work on automated literature review and collaborative generation (Tang, Duan, & Cai, 2025, *EMNLP*) and applied multi-agent tools (Zhao & Duan, 2025) further establish the feasibility of agent-based hypothesis generation.

Second, I have shown that AI can **construct experimental stimuli** comparable to human-designed materials. Using *StimMAS*, we replicated classic psycholinguistic effects with 300 participants across three paradigms, confirming the reliability of AI-generated stimuli.

Third, our team pioneered the use of **LLMs as computational participants**. The *MacBehaviour* framework (Duan, Li, & Cai, 2025, *Behavior Research Methods*) formalized AI-based behavioural experimentation, revealing human-like sensitivity to mental lexicon, syntax, semantics, and grammaticality (Cai, Duan, Haslett, Wang, & Pickering., 2024, cited 142 times as of 17/10/2025; Xiao, Duan, Haslett & Cai., 2025; Duan, Xiao, Tang & Cai., 2025; Qiu, Duan & Cai., 2025). Eye-tracking comparisons (*Wang, *Duan, & Cai, 2025) further demonstrated strong alignment between human gaze patterns and model attention, as well as between ERP amplitude and LLM surprisal(Wu, Duan, & Cai, 2025). Complementary work on model interpretability (Duan et al., 2025; Zhou et al., 2025, *COLING*) links these methods to theoretical on language processing.

Collectively, this body of research has produced validated tools (*StimMAS*, *MacBehaviour*), datasets, and interdisciplinary methods that render the proposed GRF project both technically feasible and conceptually mature.
